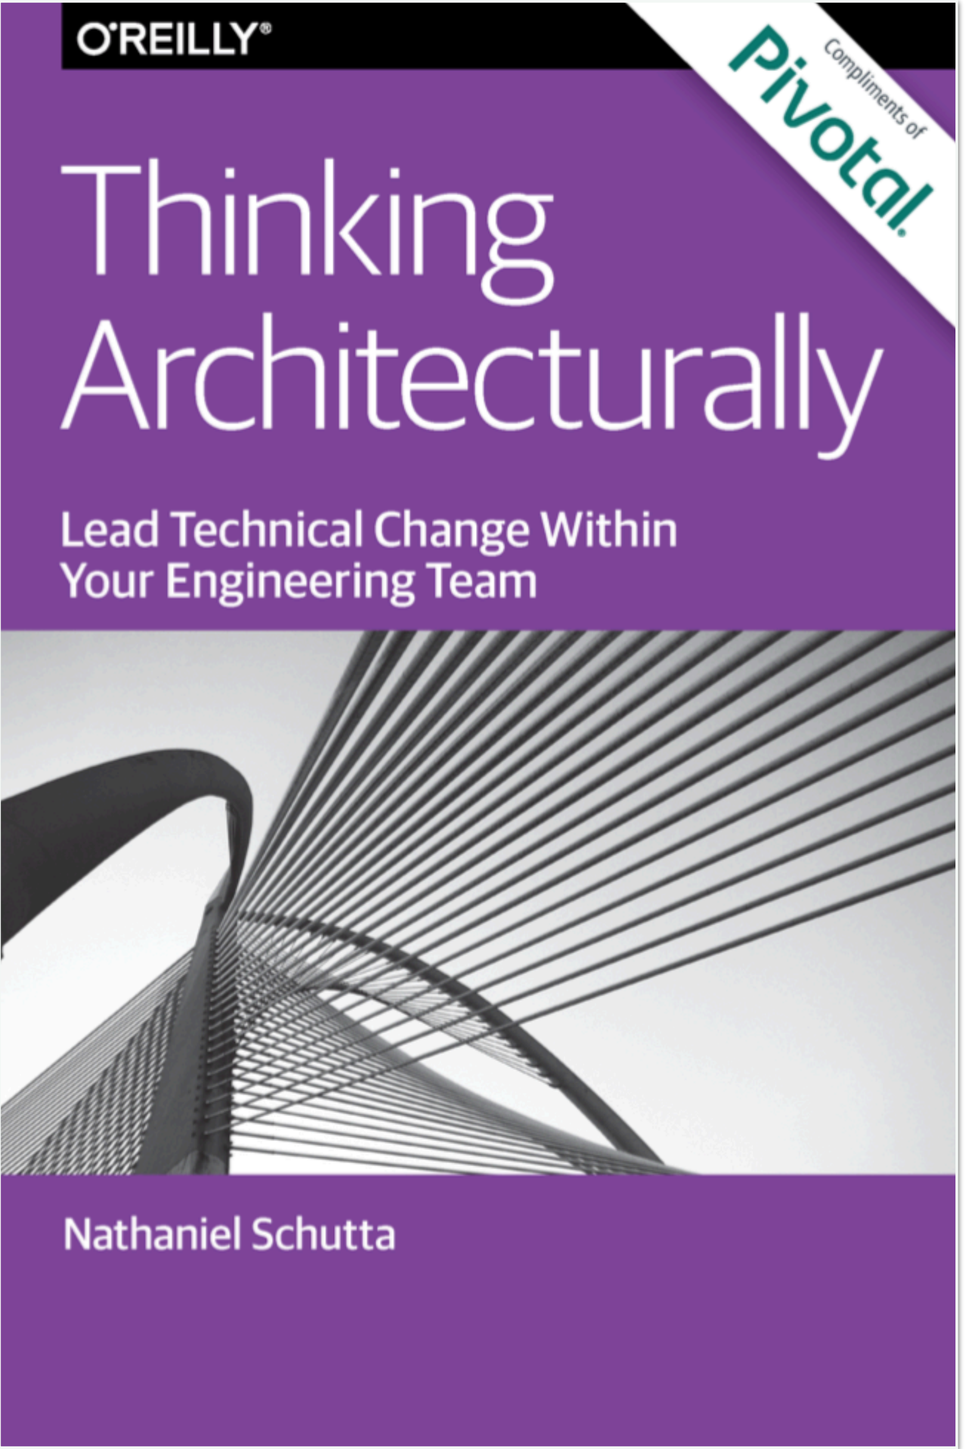
Thinking Architecturally

Nathaniel T. Schutta
@ntschutta
ntschutta.io



https://content.pivotal.io/ebooks/thinking-architecturally

Architecting is hard…

Many competing agendas.

Technology changes.

Constantly.

Feature not a bug.

Keeps things interesting…

We want to avoid legacy platforms.

But we can’t change
things every few months.

“Our app has 4 different UI frameworks…”

Developers kept chasing
the new hotness.

How do we avoid that?

How do we evaluate new technology?

I have no idea what language/ framework/platform is “next”.

No one does.

But I can guarantee you this much:

It will be different than what we use today.

Five years from now we will be using something that isn’t invented yet.

Chasing the new thing.

Technology changes.

Constantly.

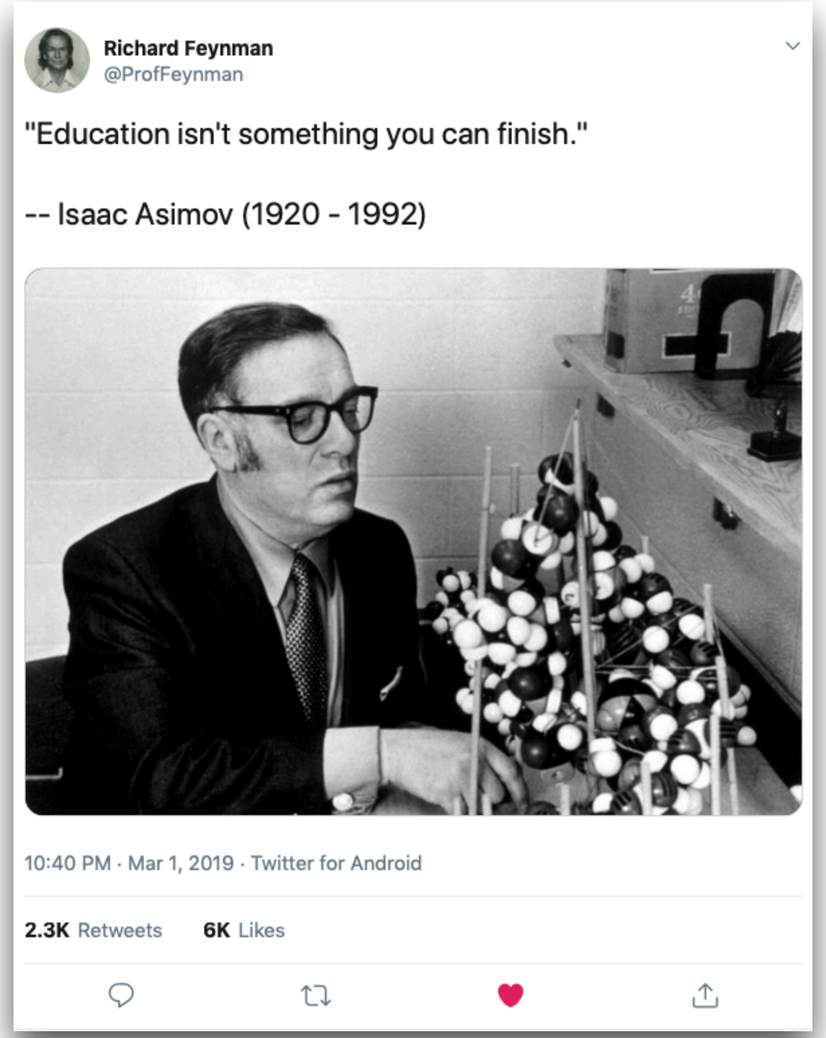
Tempting to always chase the “new hotness”.

Bleeding edge.

It’s fun!

Part of being in this industry.

https://mobile.twitter.com/ASpittel/status/1101165138361479169



https://mobile.twitter.com/ProfFeynman/status/1101703855937675266

Our understanding constantly evolves.

Thread

Benedict Evans
@BenedictEvans

There are things you understand well enough to have strong opinions on, things you know just well enough to know what others' opinions are, and things where you can have no opinion. The complication in tech is that things move between these categories all the time.

Replying to @BenedictEvans
In tech, there are:
Things you're starting to learn about
Things you know well
Things you're no longer following
Things you were an expert on but moved on from years ago and half-forgot

In tech, the point that you really understand something is the point it's becoming irrelevant

5 79 193

Benedict Evans @BenedictEvans · Dec 30
For example, I used to know all about radio networks, mobile networks and the Japanese mobile market iMode! IAppli! PHS!). Now, none of that matters. Most questions about smartphones are now moving rapidly down the list as well. On to new questions.

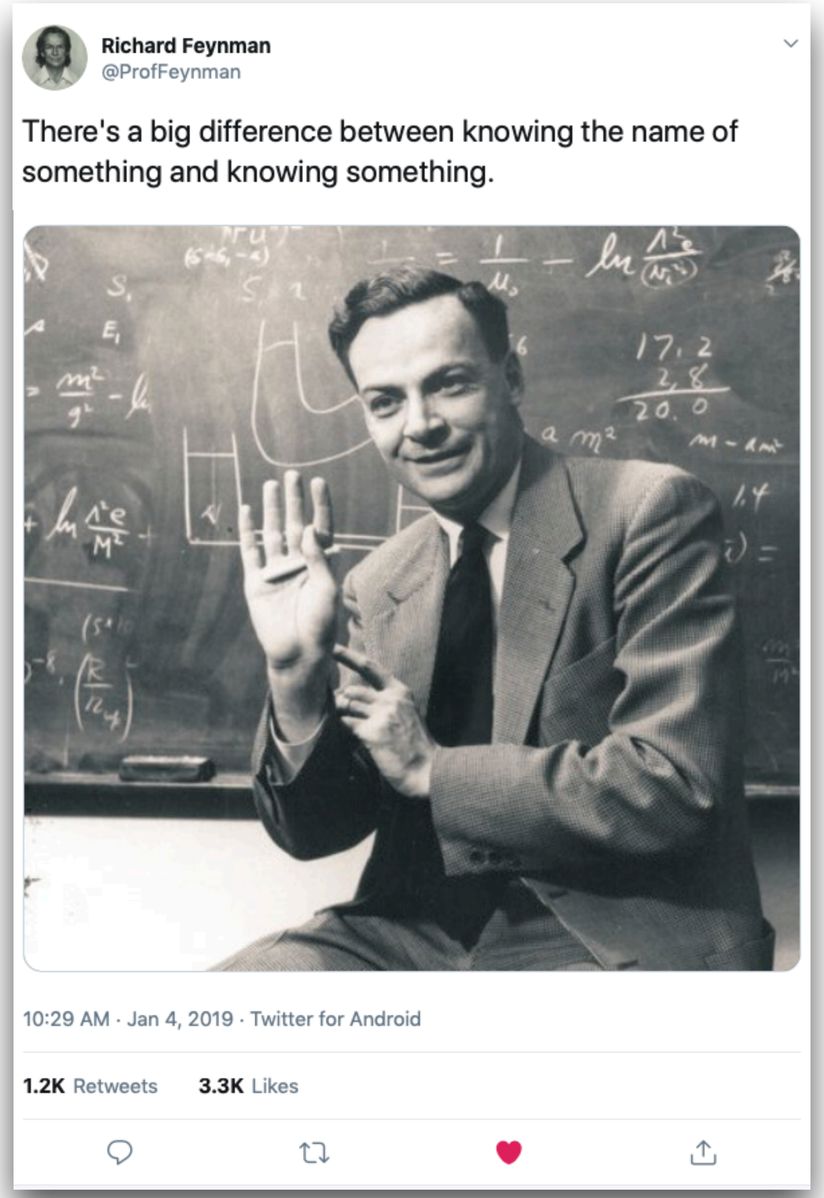
🔥🔥🔥🔥The speed of the feed.

Let’s be honest…

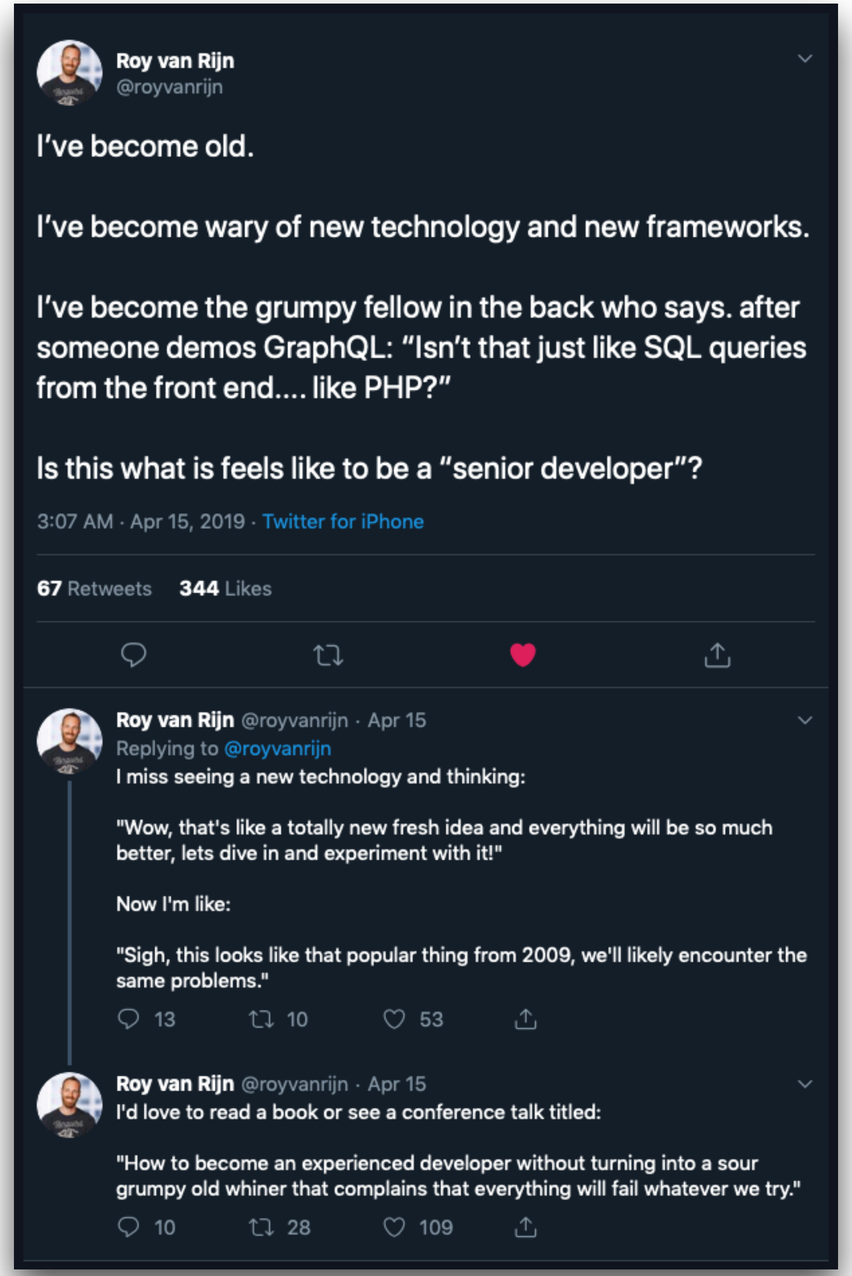
Developers have opinions!

Often *very* strong opinions.



https://mobile.twitter.com/ProfFeynman/status/1081226199521808386

Maybe we fear old things?



https://mobile.twitter.com/royvanrijn/status/1117700862959411200

Thread

Jeff Johnson (Mac/iOS developer for hire) @lapcats... · Dec 21

It's said that "senior" developers tend to be afraid of learning new things. This has always struck me as absurd, because who hasn't learned a ton of new things over the course of 10+ years of programming? Almost impossible not to.

4 5 18

Jeff Johnson (Mac/iOS developer for hire) @lapcats... · Dec 21

It almost feels as though less experienced developers are projecting their own fears onto others with more experience.

1 1 8

Jeff Johnson (Mac/iOS developer for hire) @lapcats... · Dec 21

I get the sense that many programmers are afraid to learn *old* things. As if the older things are impossibly arcane and complex, compared to the supposed simplicity and elegance of new tech.

1 6 18

Jeff Johnson (Mac/iOS developer for hire) @lapcats... · Dec 21

They have a strong preference for the new. They'd rather use unfinished, buggy, unproven technology than older, refined, stable, tested tech. Even if it reinvents or indeed breaks the wheel.

2 7 15

Jeff Johnson (Mac/iOS developer for hire) @lapcats... · Dec 21

So now there's a of excitement about a "UnicornKit" that combined UIKit and AppKit into one. But do people realize that unless UnicornKit is simply UIKit, you're going to have to learn something else anyway?

1 3 9

Jeff Johnson (Mac/iOS developer for hire) @lapcats... · Dec 21

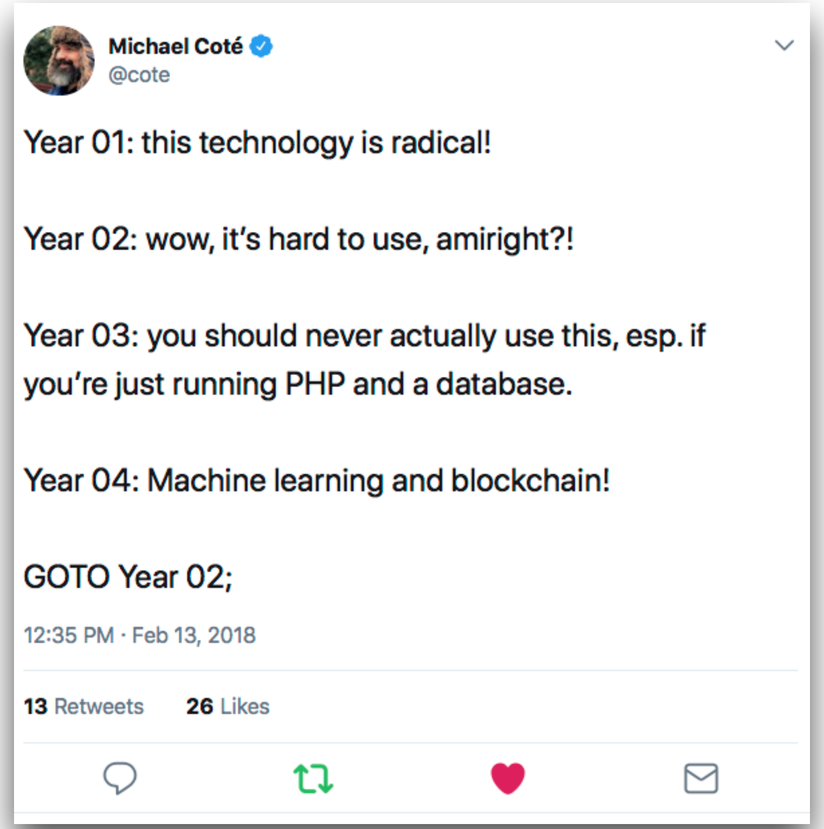
Why is learning UnicornKit harder than learning AppKit? Many developers have successfully written both Mac and iOS apps. It's not as hard as you may think if you have no experience with AppKit.

2 3 8

Jeff Johnson (Mac/iOS developer for hire) @lapcats... · Dec 21

Also, any new technology is going to be chock full of bugs. AppKit has its bugs, yes, but it's assuredly vastly more reliable and stable than UnicornKit

Predictable hype cycle.



https://mobile.twitter.com/cote/status/963481741171265537

How do we know where
not to use a technology?

Trial and error.

Developers tend to get bored quickly.

Learning keeps it fresh.

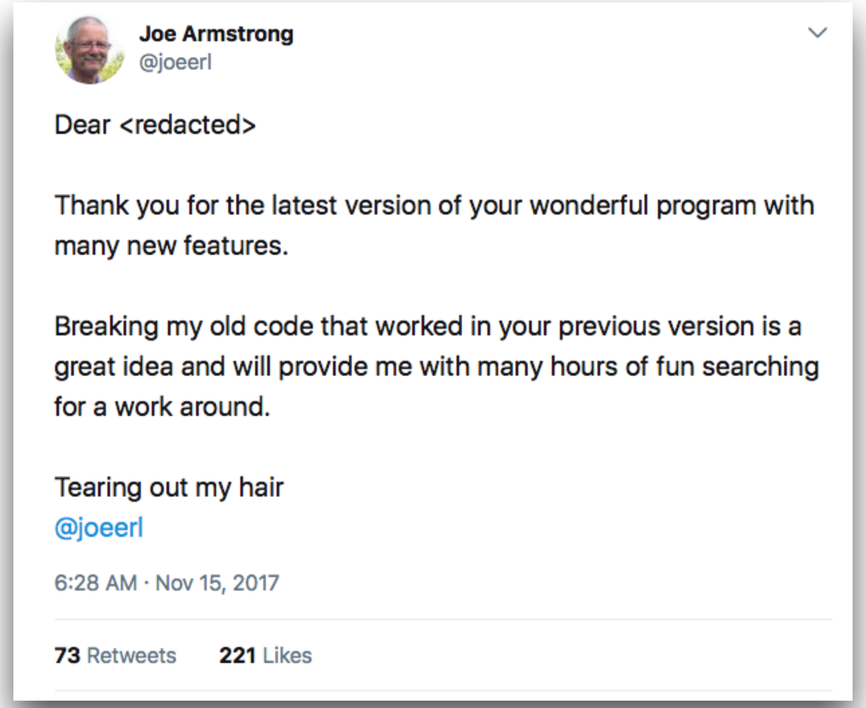
But we have to deliver business value.

Can’t do that if we’re always experimenting.

Have to commit at some point.

Develop some expertise.

Bleeding edge…means you will bleed!



https://mobile.twitter.com/joeerl/status/930774515512201216

Pioneers…the ones with arrows in their backs.

What is your strategy?

How do we avoid dead platforms?

Without constantly changing direction?

Strategy.

Hope is not a strategy!

But it is what rebellions are built on.

We need to be deliberate.

There are a lot of bits out there...

New languages,
techniques, approaches.

How do you keep up?

Blogs? Books? Twitter?
Podcasts? Conferences?

Develop a routine.

Block out Friday afternoon.
Tuesday over lunch. Whatever fits.

Consider “morning coffee”.

Take 15-30 minutes in the morning to peruse the tech news.

Before the day gets away from you…

Attention is precious.

The new hotness is not our only concern though.

Need to stay current on the things we are using day in day out.

The Heartbleed Bug

The Heartbleed Bug is a serious vulnerability in the popular OpenSSL cryptographic software library. This weakness allows stealing the information protected, under normal conditions, by the SSL/TLS encryption used to secure the Internet. SSL/TLS provides communication security and privacy over the Internet for applications such as web, email, instant messaging (IM) and some virtual private networks (VPNs).

The Heartbleed bug allows anyone on the Internet to read the memory of the systems protected by the vulnerable versions of the OpenSSL software. This compromises the secret keys used to identify the service providers and to encrypt the traffic, the names and passwords of the users and the actual content. This allows attackers to eavesdrop on communications, steal data directly from the services and users and to impersonate services and users.

What leaks in practice?

We have tested some of our own services from attacker's perspective. We attacked ourselves from outside, without leaving a trace. Without using any privileged information or credentials we were able steal from ourselves the secret keys used for our X.509 certificates, user names and passwords, instant messages, emails and business critical documents and communication.

How to stop the leak?

As long as the vulnerable version of OpenSSL is in use it can be abused. Fixed OpenSSL has been released and now it has to be deployed. Operating system vendors and distribution, appliance vendors, independent software vendors have to adopt the fix and notify their users. Service providers and users have to install the fix as it becomes available for the operating systems, networked appliances and software they use.

Equifax Hackers Exploited Months-Old Flaw

by BEN POPKEN

Equifax announced late Wednesday that the source of the hole in its defenses that enabled hackers to plunder its databases was a massive server bug first revealed in March.

For the rest of the IT world, fixing that flaw was a "hair on fire moment," a security expert said, as companies raced to install patches and secure their servers. But at Equifax, criminals were able to pilfer data from mid-May to July, when the credit bureau says it finally stopped the intrusion.

Equifax, Software Company Blame Each Other for Security Breach 1:52

"We know that criminals exploited a U.S. website application vulnerability," Equifax said in an update on its website Wednesday night. "The vulnerability was Apache Struts CVE-2017-5638." Equifax said it was working with a leading cybersecurity firm, reported to be Mandiant, to investigate the breach. Mandiant declined an NBC News request for comment.

WHY NORSE?

Justin Smith Follow
Identity and Security Geek
Apr 19, 2016 · 8 min read

The Three Rs of Enterprise Security: Rotate, Repave, and Repair

At high velocity, the three Rs starve attacks of the resources they need to grow. It's a complete 180-degree change from the traditional careful aversion to change to mitigate risk. Go fast to stay safer—in other words, speed reduces risk.

—Justin Smith

What is your patching strategy?

What version of X are you on?

Some organizations have a policy of N or N-1.

Do they measure it? Do they enforce it?

What needs to change in your culture to stay at N?

What hurts more? Changing your patching strategy?

Or being on the receiving end of the latest “largest hack ever”?

Pros and Cons.

Every technical choice
involves tradeoffs.

When we find ourselves presented with technology that promises to offer us drastic improvements, we need to look for the trade-offs.

— Susan J. Fowler
Production-Ready Microservices

Essence of design.

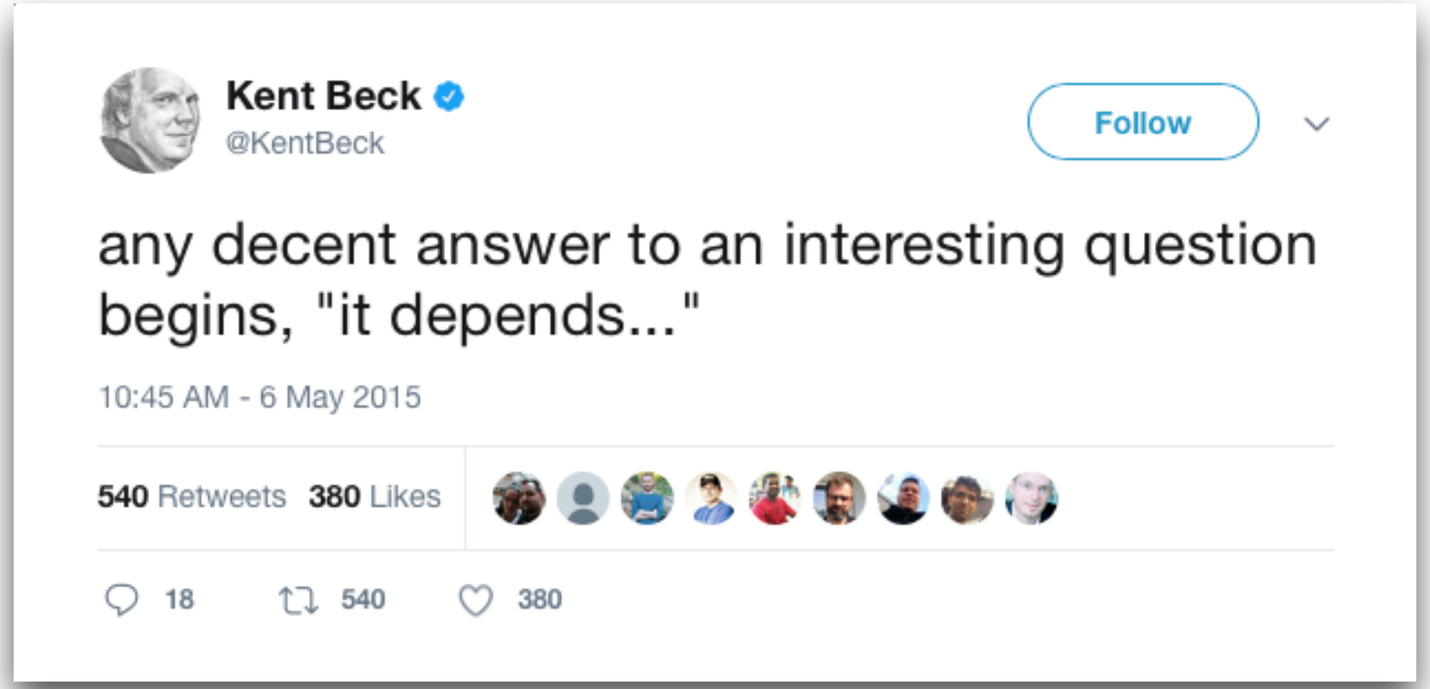
To paraphrase Harry Truman…

Give me a one handed technologist.

Should we use React or Angular?

Should we refactor to microservices?

Should we be on prem
or public cloud?



https://twitter.com/KentBeck/status/596007846887628801

In many cases?

Balancing those opposing forces is the art of architecture.

No tech is perfect, don’t pretend it is.

Acknowledge the negatives.

What do you like about it?

What don’t you like about it?

What would you add?

What would you remove?

King of Java for a day...

https://mobile.twitter.com/kelseyhightower/status/963428093292457984

How does it stack up to alternatives?

The spreadsheet approach.

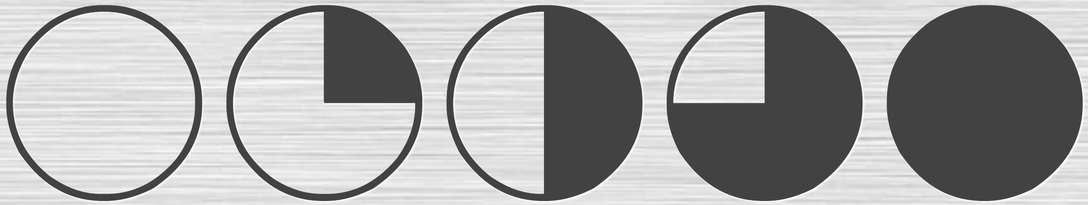
Options across the top.

Criteria down the left.

Criteria can be weighted.

Harvey balls.

http://en.wikipedia.org/wiki/Harvey_Balls



How closely does does it map to the criteria?

Very effective…

	Angular	React
Documentation		
Community		
Committer diversity		
Codebase		
Testability		
Update history		
Maturity		

	Angular	React
Stability		
Extensibility		
Support		
Training		
Hiring		
Corporate fit	?	?
Usage		

What criteria should you use?

How should they be weighted?

Up to you.

You can tip the scales…

Usually backfires.

Quality Attributes.

Sometimes called non functional requirements.

Or quality goals, constraints, quality of service goals…

Cross-functional requirements.

Architecturally significant requirements.

The “ilities”!

Customers usually focus
on functionality.

It’s what they “see” after all.

Obviously important we meet their needs!

But we have to look beyond that.

Vital that we focus on quality attributes.

Service level objectives if you will.

What are some quality attributes?

Maintainability.

Scalability.

Reliability.

Security.

Deployability.

Simplicity.

Usability.

Compatibility.

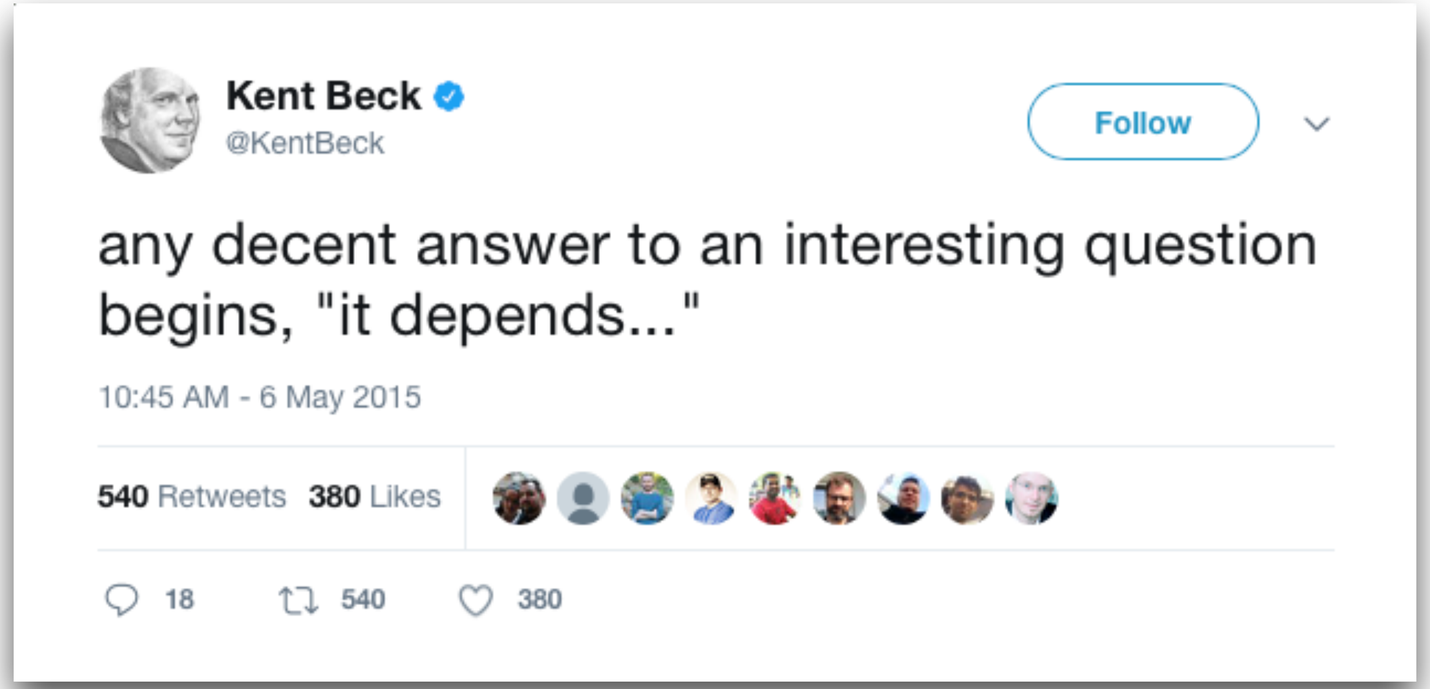
Fault tolerance.

Modularity.

The list goes on and on!

http://en.wikipedia.org/wiki/List_of_system_quality_attributes

What quality attributes
do you focus on?



https://twitter.com/KentBeck/status/596007846887628801

Depends a lot on the type of software you build!

We don't get to turn
every knob to 11 do we?

Inverse relationships.

Maximizing one may minimize another.

Security and usability for instance.

It’s a balance.

Some are obvious to our customers.

If the systems won't
support the user load…

Fairly easy to convince
people of the importance.

Others - are “invisible”.

Or at least harder to see.

Maintainability and
simplicity for instance.

How do we get the decision makers to buy in?

What techniques can we use to influence them?

Outline the benefits.

Find common ground.

Avoid aggression.

Listen.

Have a conversation!

Can be hard to convince people!

Two approaches...

Find the influencers.

Influence the influencers.

Approach as equals.

Rely on the strength of your ideas and your reputation.

Your reputation speaks for you when you aren’t there.

Not sure what your rep is?

Ask.

May not like the answer…

But you can work to change it.

Find common ground.

Reciprocity rules…

Be helpful.

Be respectful.

Research your ideas.

Use trusted sources.

Recruit credible allies.

Nothing wrong with bringing help!

Speak their language.

Avoid techno babble.

You may be impressed by the jargon…

Most customers aren’t.

What resonates in your organization?

Cost savings?

Developer productivity?

Speed to market?

Shape your approach accordingly.

The iDon’tDrive System.

Self driving cars are all
the rage these days.

Let’s pretend our
company has the answer!

VCs can’t give us money fast enough.

Customers are flocking to
our stylish website.

Our team has been tasked to build a backend system.

The cars generate a lot of data.

Battery level, health of the engine, maintenance.

Basics

- Car “phones home” on a regular basis.
- Sends a standard data payload including VIN.
- Demand is extremely high.
- Expect millions of cars on the road in the next 3 years.
- Marketing is full of great ideas…
- System must be available 24x7.

Customer Facing

- Web interface as well as mobile apps.
- Allow an owner to check the stats of their car.
- When does it need maintenance? How's the battery? Etc.
- Must be secure - only access *your* car.
- Allow owner to summon the car to their present location.
- Push notifications for maintenance, low battery etc.

Company Facing

- Fleet generates a lot of information that can be mined.
- Data must be anonymized.
- Ensure only authorized users have access.
- Audit access to customer data.
- Push software updates to the car.
- Push recall/update information to customers.

What quality attributes matter most here?

What words/phrases stand out to you?

Basics

- Car "phones home" on a regular basis.
- Sends a standard data payload including VIN.
- Demand is extremely high
- Expect millions of cars on the road in the next 3 years.
- Marketing is full of great ideas…
- System must be available 24x7.

Customer Facing

- Web interface as well as mobile apps.
- Allow an owner to check the stats of their car.
- When does it need maintenance? How's the battery? Etc.
- Must be secure - only access *your* car.
- Allow owner to summon the car to their present location.
- Push notifications for maintenance, low battery etc.

Company Facing

- Fleet generates a lot of information that can be mined.
- Data must be anonymized.
- Ensure only authorized users have access.
- Audit access to customer data.
- Push software updates to the car.
- Push recall/update information to customers.

Auditability! Availability.
Security. Usability.

How would you rank them?

Depends on the
perspective of the system!

From a driver/owner…

Rank	Quality Attribute	Comments
1	Usability	Customers will not read a manual on how to use the iDon’tDrive system.
2	Availability	Owner must be able to summon a car 24x7.
3	Security	Owner must be confident that only then can access their car.
4	Reliability	System must work as expected when called upon to maintain confidence in the system.

From a service center…

Rank	Quality Attribute	Comments
1	Security	Only authorized users should have access to the system.
2	Auditability	System should audit access to determine appropriate usage of the system.
3	Efficiency	System should be minimize the time service representatives need to find information.
4	Usability	System should require minimal training and allow new service reps to be productive quickly.

What architectural
decisions result from that?

Rank	Quality Attribute	Decision(s)
1	Usability	UX designers will be engaged and ensure the design requires no training to use.
2	Availability	System will be geographically dispersed across multiple data centers. Zero downtime deploys will be utilized.
3	Security	Standard three zone security will be employed. System will encrypt personally identified information and follow all security standards.
4	Reliability	System will be geographically dispersed across multiple data centers.

Questions?

Your turn!

What quality attributes
matter most for your kata?

How would you rank them?

What architectural decisions might result?

Establish principles.

We can’t be everywhere…

We can’t be involved
with every decision.

We can establish principles.

Guard rails.

Guide posts.

North stars.

Create the environment within which our projects can thrive.

But how do we know if projects are following our principles?

Fitness functions.

We’re all familiar with the second law of thermodynamics…

Otherwise known as a teenagers bedroom.

The universe really
wants to be disordered.

Software is not immune from this!

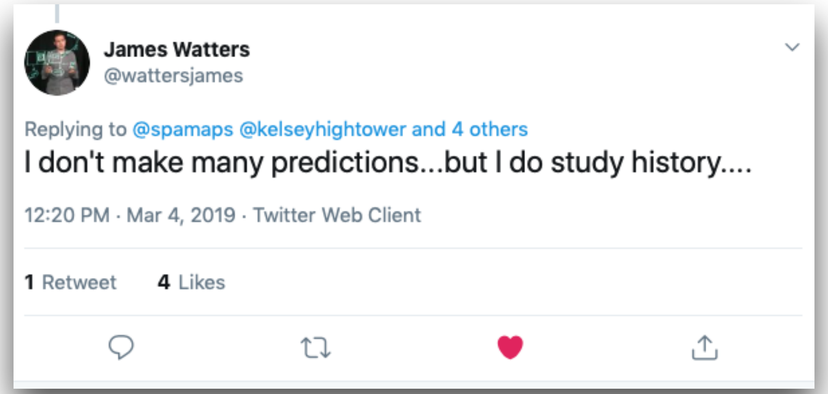
We go through the thoughtful effort to establish an architecture…

How do we maintain it?

We can’t spend every minute of every day on every project.

How do we ensure teams continue to make good decisions?

We cannot predict the future.



https://mobile.twitter.com/wattersjames/status/1102634943975317504

That’s not entirely true.

One constant - change.

Architecture is often defined as the decisions that are hard to change.

Or the decisions we wish we got right.

But we *know* things will change!

Isn’t this approach anti agile?

Contributing factor to the “we’re agile, we don’t have architects” theory.

You definitely have people making architectural decisions!

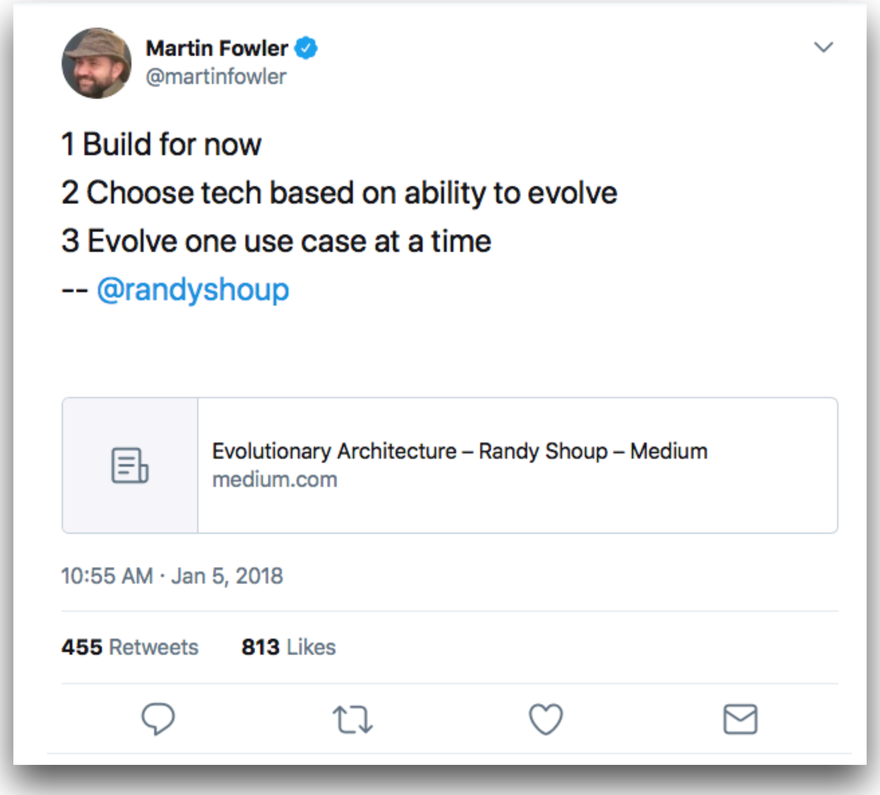
Sure hope they are
making good ones…

You’ll know in a year or two.

“Our app has 4 different UI frameworks…”

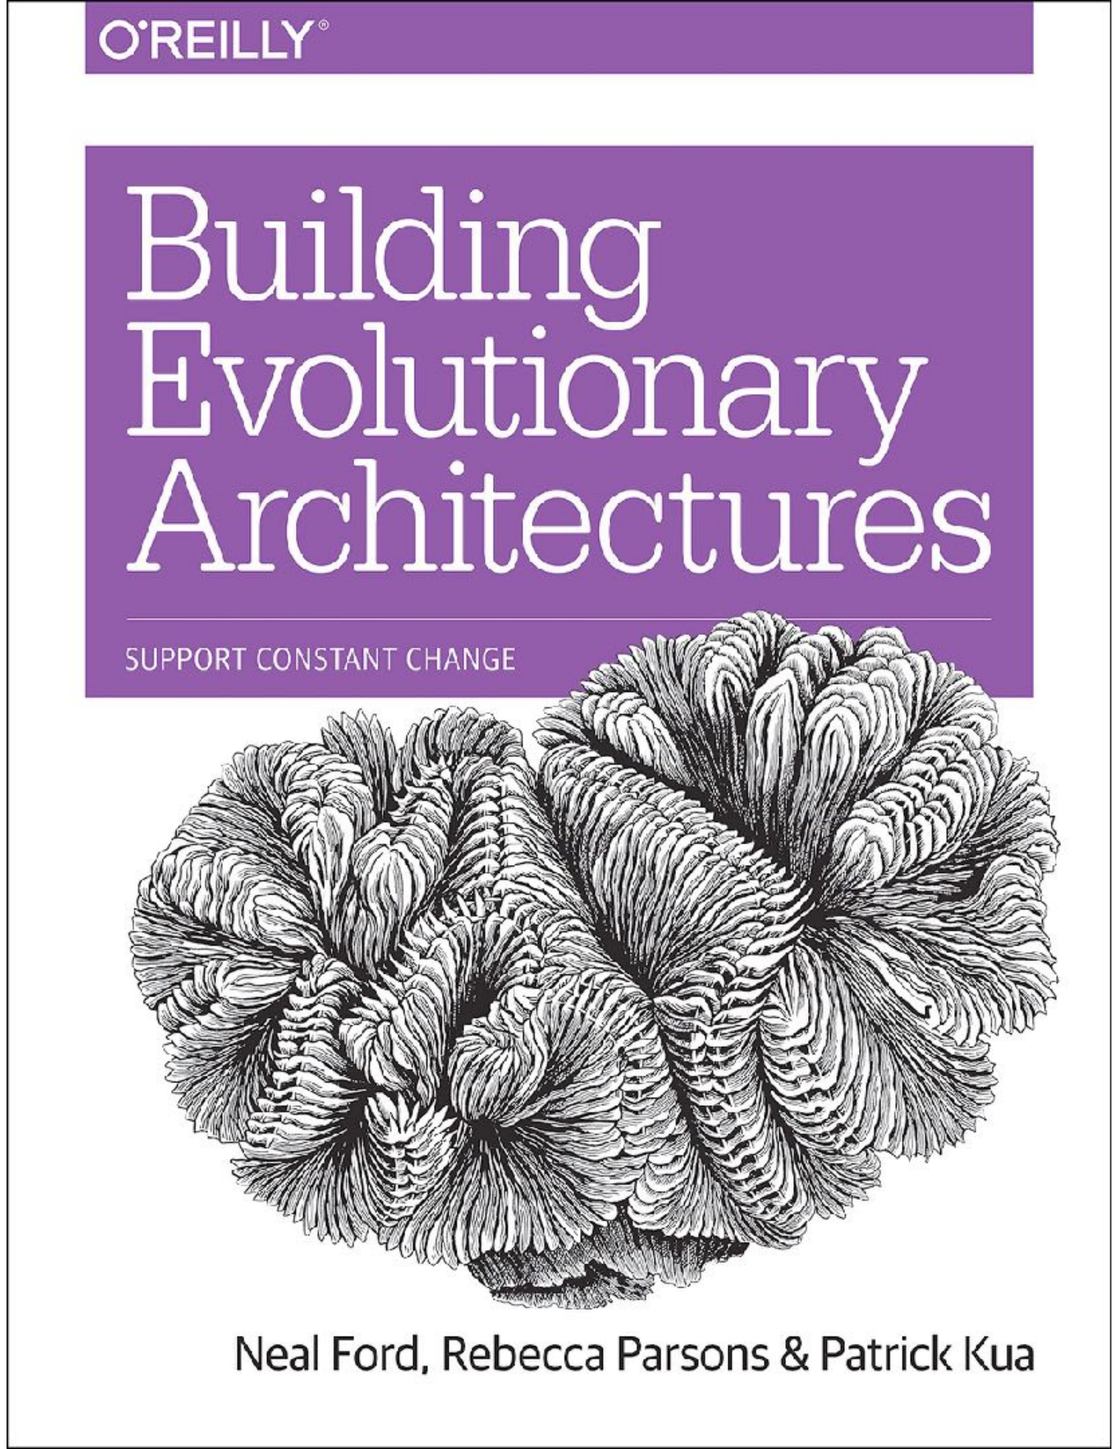
What do we do about that?

Maybe we should change
our assumptions.



https://mobile.twitter.com/martinfowler/status/949323421619548161

What if our architectures expected to change?

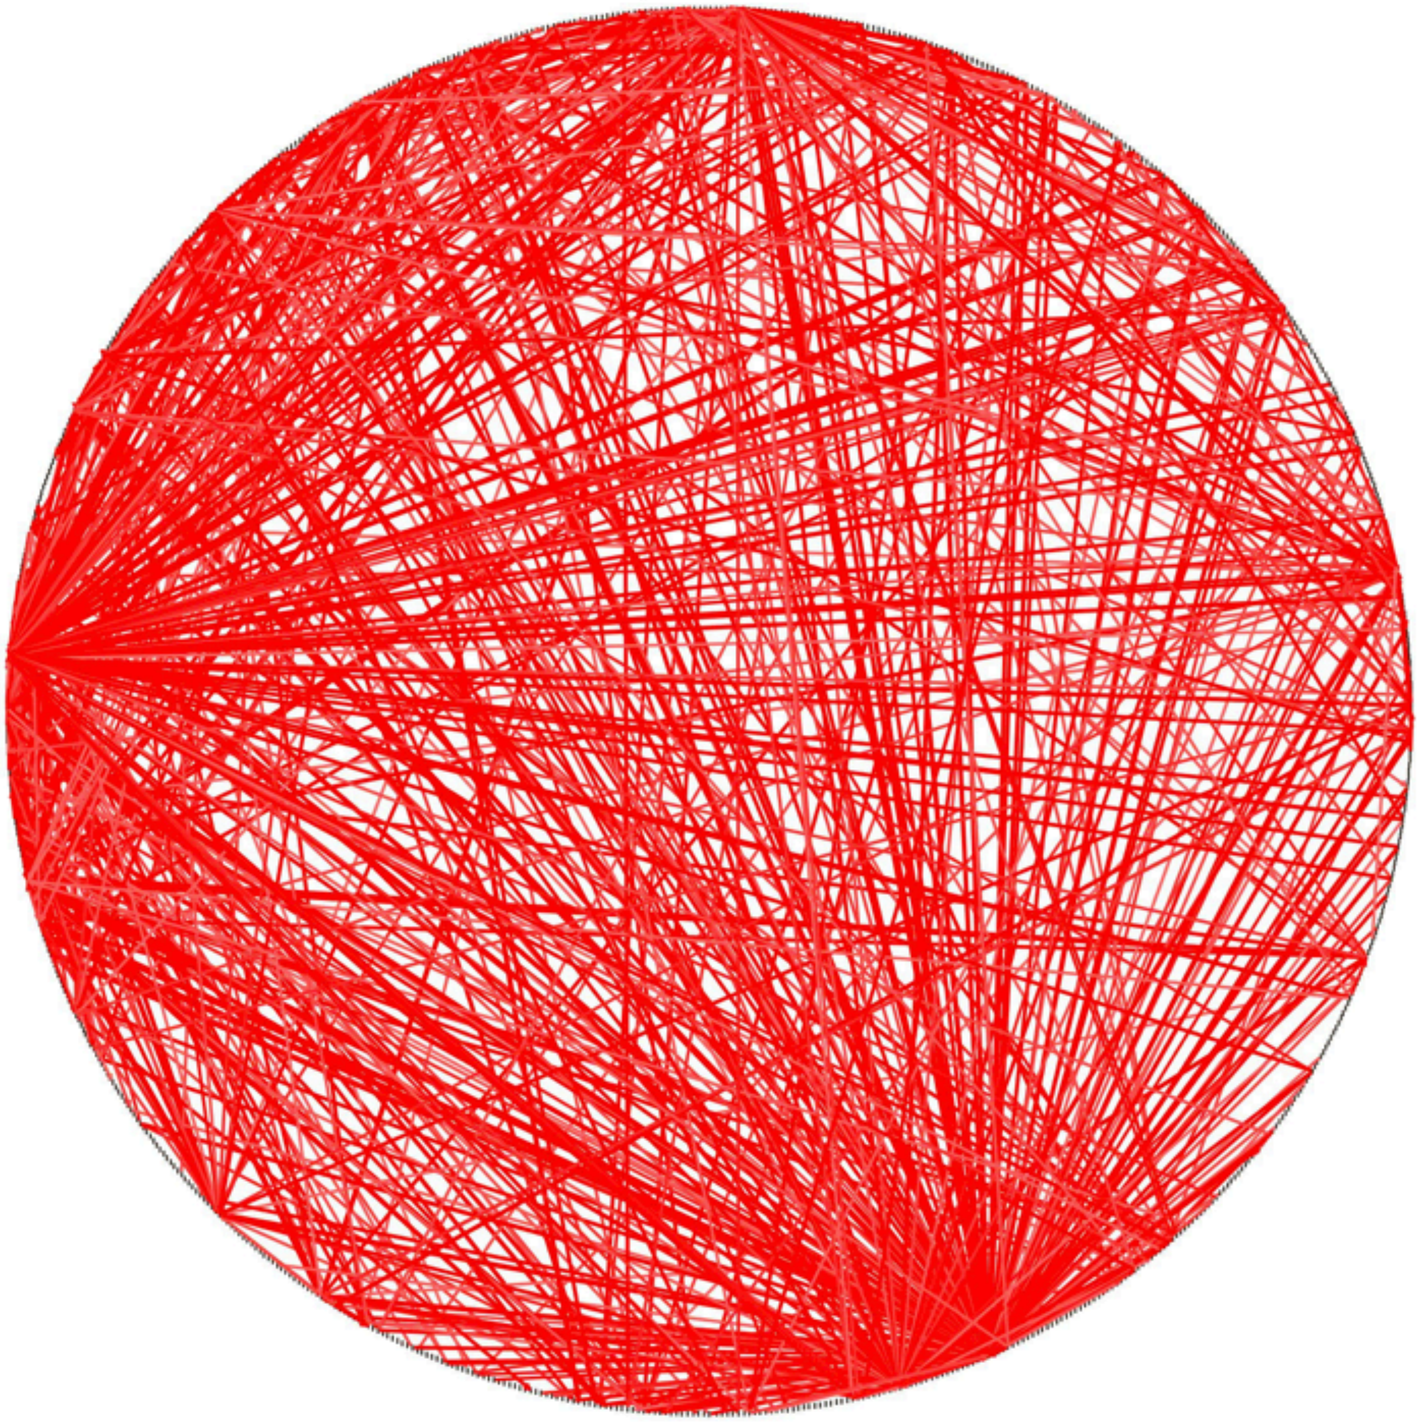


http://evolutionaryarchitecture.com

An evolutionary architecture supports guided, incremental change across multiple dimensions.

— Building Evolutionary Architectures

Some architectures are more evolvable than others…



http://evolutionaryarchitecture.com

Components are deployed,
features are enabled via toggles.

Allows us to change incrementally.

Also perform hypothesis driven development!

But how do we ensure the architecture still meets our needs?

How do we know if a solution violates part of the architecture?

Fitness functions!

Concept comes from evolutionary computing.

Is this mutation a success?

Are we closer to or
further from our goal?

For architecture, it is all about protecting the ilities.

And balancing the tradeoffs.

We want to capture and preserve the key architectural characteristics.

First, we need to identify those key measures for project success.

Service Level Indicators if you will.

What can we measure?

Sometimes we let what we can measure dictate too much…

Just because we can measure it doesn't mean it matters!

Lines of code anyone?

Once we have our metrics,
we can set some goals.

Service Level Objectives.

SLO !== SLA!

Now we can create a fitness function!

Basically, a set of tests we execute to validate our architecture.

How close does this particular design get us to our objectives?

Ideally, all automated. But we may need some manual verifications.

For example…

All service calls must respond within 100 ms.

Cyclomatic complexity
shall not exceed X.

There are no cyclic dependencies.

Consumer Driven Contracts.

https://martinfowler.com/articles/consumerDrivenContracts.html

Spring Cloud Contract 2.1.1

Spring Cloud Contract is an umbrella project holding solutions that help users in successfully implementing the Consumer Driven Contracts approach. Currently Spring Cloud Contract consists of the Spring Cloud Contract Verifier project.

Spring Cloud Contract Verifier is a tool that enables Consumer Driven Contract (CDC) development of JVM-based applications. It is shipped with Contract Definition Language (DSL) written in Groovy or YAML. Contract definitions are used to produce following resources:

- by default JSON stub definitions to be used by WireMock (HTTP Server Stub) when doing integration testing on the client code (client tests). Test code must still be written by hand, test data is produced by Spring Cloud Contract Verifier.
- Messaging routes if you're using one. We're integrating with Spring Integration, Spring Cloud Stream and Apache Camel. You can however set your own integrations if you want to.
- Acceptance tests (by default in JUnit or Spock) used to verify if server-side implementation of the API is compliant with the contract (server tests). Full test is generated by Spring Cloud Contract Verifier.

Spring Cloud Contract Verifier moves TDD to the level of software architecture.

To see how Spring Cloud Contract supports other languages just check out this blog post.

Features

When trying to test an application that communicates with other services then we could do one of two things:

- deploy all microservices and perform end to end tests
- mock other microservices in unit / integration tests

Both have their advantages but also a lot of disadvantages. Let's focus on the latter.

Deploy all microservices and perform end to end tests

Advantages:

Unit test your Java architecture

Start enforcing your architecture within 30 minutes using the test setup you already have.

Start Now

ArchUnit is a free, simple and extensible library for checking the architecture of your Java code using any plain Java unit test framework. That is, ArchUnit can check dependencies between packages and classes, layers and slices, check for cyclic dependencies and more. It does so by analyzing given Java bytecode, importing all classes into a Java code structure. You can find examples for the current release at ArchUnit Examples and the sources on GitHub.

Scientist: Measure Twice, Cut Over Once

Jesse Toth

Today we're releasing Scientist 1.0 to help you rewrite critical code with confidence.

As codebases mature and requirements change, it is inevitable that you will need to replace or rewrite a part of your system. At GitHub, we've been lucky to have many systems that have scaled far beyond their original design, but eventually there comes a point when performance or extensibility break down and we have to rewrite or replace a large component of our application.

Problem

A few years ago when we were faced with the task of rewriting one of the most critical systems in our application — the permissions code that controls access and membership to repositories, teams, and organizations — we began looking for a way to make such a large change and have confidence in its correctness.

There is a fairly common architectural pattern for making large-scale changes known as Branch by Abstraction. It works by inserting an abstraction layer around the code you plan to change. The abstraction simply delegates to the existing code to begin with. Once you have the new code in place, you can flip a switch in the abstraction to begin substituting the new code for the old.

Performance - **average** and **maximum** response times.

Scalability - average response times across number of users and requests.

Number of timeouts and application faults.

Nearing the next price tier with our cloud provider.

Hard failure of an application will spin up a new instance.

Alert when things start to go out of band!

Your turn!

What fitness functions would you recommend for your kata?

Don’t worry about implementing them!

Fitness functions remind us what is important in our architecture.

Informs our thinking about tradeoffs.

Different categories of fitness functions.

Atomic vs. Holistic.

Some characteristics must be tested in isolation…others cannot.

Holistic fitness functions
test combined features.

We can’t test every possible combination!

Must be selective, driven by the value of the architectural characteristic.

Triggered vs. Continual.

Must consider frequency of execution.

Fitness functions can be triggered by something - checkin, QA pass…

Continual tests are just that.

Monitoring Driven Development!

http://benjiweber.co.uk/blog/2015/03/02/monitoring-check-smells/

Static vs. Dynamic.

Static tests have a fixed result - they either pass or they fail.

Nearly any test based on a metric.

Other fitness functions have a shifting definition of success.

Generally defined within a range of acceptable outcomes.

Automated vs. Manual.

Automation is good!

Ideally most of our fitness functions will live in our deployment pipeline.

Not everything is amenable to automation though…

Legal.

Existing projects.

Temporal fitness functions.

Essentially a reminder.

Check for an upgrade of library X.

Break upon upgrade tests.

Clearly we want to identify fitness functions as early as we can.

The discussion about the tradeoffs is invaluable to our understanding.

Help us prioritize features.

May lead us to break a system up to isolate certain features.

We can’t know everything up front.

Fitness functions will emerge
as the system changes.

But we should strive to identify as many as we can up front.

We can also classify fitness functions.

Key - critical decisions.

Relevant - considered but unlikely to influence the architecture.

Not Relevant - won't impact our decisions.

Can still be very useful to identify the non relevant dimensions!

Keep fitness functions visible!

Need to review the fitness functions.

Are they still relevant?

Are there new dimensions we need to track?

Are there better ways of measuring/ testing our current fitness functions?

Aim for at least an annual review.

Architectural Decisions.

They happen!

How do we document them?

Lightweight Architecture Decision Records.

https://www.thoughtworks.com/radar/techniques/lightweight-architecture-decision-records

Title/ID.

What is the problem?

List assumptions and constraints.

What are the options?

List the pros and cons of each alternative.

Which one did you chose?

Why?

Status - is this a proposal or has this been accepted? Is it now deprecated?

Consequences of the decision.

Consider a “time capsule”.

Screen cast or podcast of what you did and why.

Prevent Monday morning quarterbacking…

Or just “why did we do this?”

Should be stored in version control.

Keep old decisions around - just make sure they are marked appropriately!

Your turn!

What architectural decision would you make on your kata?

What are the options?

Create an ADR!

Architecting is hard…

We have a lot to juggle!

Important that we thing strategically.

We can’t afford
Resume Driven Design.

Good luck!

Questions?

Thanks!

SpringOne TOUR by Pivotal

Cloud-Native Java From the Source

The SpringOne Tour brings the best Cloud-Native Java content from our flagship conference directly to you. In 2 days, you'll learn about both traditional monolithic and modern, Cloud-Native Java from the source. Experience valuable facetime with expert Pivotal speakers in both traditional presentation and informal Pivotal Conversations about modern Application Development, DevOps, CI/CD, Cloud and more.
